

Analysis of the risk to make strokes

In this project we look for the factors that increase the risk of strokes.

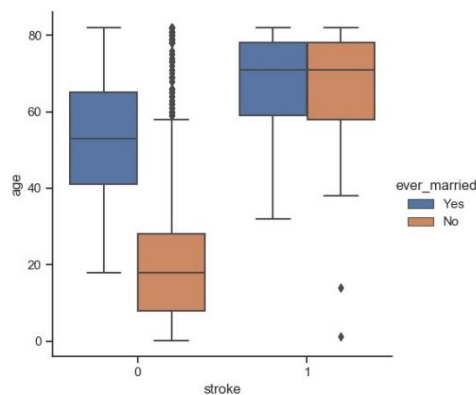

for example: age, hypertension, heart disease, work type, smoking status.

-The relationship between the incidence of stroke and age is a positive relationship, as the elderly are more susceptible to stroke than young people.

-The risk of strokes is the same for both sexes.

-The photo shows the relationship between marriage, age, and stroke.

****Next step I will use the classification to complete the rest of the project**
